INTRODUCTION

1.1 INTRODUCTION

*The objective of this report is to investigate the possible earthquake response of a tripod-type ocean structure for the East Coast Air Combat Maneuvering Range offshore Kitty Hawk, North Carolina.

The structure considered herein, a three-pile structure with equilaterally spaced jacket legs, is located in a water depth (MLW) of 105 feet. The anchoring of the structure is achieved by driving piles through the jacket legs into the seabed. A superstructure, consisting of an upper deck, an equipment deck, columns and stairs, is attached to the piling above the jacket.

1.2 ENGINEERING DATA

Engineering data which serve as the basis for the earthquake analysis are listed as follows:

A. Environmental Conditions

MLW Depth	105 feet
Earthquake Zoning	Zone 1
Effective Horizontal Ground Acceleration	$G=0.05^*$

(where G =Ratio of effective horizontal acceleration to gravitational acceleration)

B. Live Loads on Structure

Equipment Deck	150 psf
Upper Deck	100 psf

C. Major Structural Dimensions

True Batter of Piling & Jacket Leg	1:6
Width at Jacket Base (Mudline)	64 feet
Width at Jacket Top (Work Point Level)	29 feet
Pile Out Side Diameter	42 inches
Jacket Leg Out Side Diameter	46 inches
Upper Deck Area	362.5 sq. ft.
Equipment Deck Area	591.5 sq. ft.
Height of Structure (From mudline to upper deck)	180 feet

*See Reference 5

1.3 PROCEDURES OF ANALYSIS

The analytical procedures presented in this report consist of two major steps: (1) Natural Frequency Analysis and (2) Space Frame Analysis due to Earthquake Loads. ICES STRUDL-II computer program was employed to perform the analyses in both steps.

Natural Frequency Analysis:

A sequence of data preparation is presented in Section 2 for the application of ICES STRUDL-II dynamic analysis capabilities. Brief descriptions of the data processing procedures are summarized as follows:

- (1) Code the structural joint coordinates and member incidences;
- (2) Calculate the member density which consists of the structural member mass, the mass of the entrapped water and the virtual mass;
- (3) Calculate joint loads (by STRUDL-II program) and rearrange new joint order list to produce improved banding.
- (4) Compute an approximate natural frequency estimate by means of Rayleigh's quotient.

Space Frame Analysis due to Earthquake Loads:

Section 3 presents the calculation of base shear due to earthquake and the distribution of the base shear

to each loading joint. The distributed joint loads are then treated as the structural loadings which in turn are applied to the idealized space frame structure. The space frame analysis then follows.

1.4 SUMMARY

Some significant results from the analyses are summarized as follows:

Vibrating in the X-Direction:

Natural Frequency	1.49 Hz.
Period	0.67 sec.
Maximum Base Shear	60.67 Kips

Vibrating in the Y-Direction:

Natural Frequency	1.45 Hz.
Period	0.69 sec.
Maximum Base Shear	60.76 Kips

- ... Analysis and design of supports and foundations for onshore refinery facilities.
- ... Development of a sequence of computer programs for the analysis of offshore structures.

SECTION 2

NATURAL FREQUENCY ANALYSIS

2.1 INTRODUCTION

The natural frequencies calculated hereinafter are for the tripod-type ocean structure in the water depth (MLW) 105 feet. The dynamic analysis capabilities of ICES STRUDL-II were employed to perform the computation of the lumped joint loads and hence the natural frequencies of the structure in both X-and Y-direction.

The mass of the structure consists of the following three components:

- (1) Mass of structural members;
- (2) Mass of entrapped water; and
- (3) Virtual mass of water.

Since the frequency is computed by means of Rayleigh's approximation, no damping coefficient for the vibrating system has been specified in the calculation.

SECTION 3

EARTHQUAKE ANALYSIS

3.1 INTRODUCTION

This section evaluates the lateral loads on the structure due to earthquake. The empirical method was used to compute the base shear and to distribute the base shear to each loading joint. The stress analysis is then followed by treating the platform structure as a space frame subjected to lateral loads at the loading joints. ICES STRUDL-II computer program was employed to perform the computation.

The computer printout for the stress analysis due to earthquake is attached in APPENDIX C.

The results of earthquake analysis may be summarized in the following table:

LOADING CONDITION	DESIGNATION	BASE SHEAR DUE TO LOADING CONDITION
		LBS
1	EARTHQUAKE LOADS IN Y-DIRECTION	59,313
2	EARTHQUAKE LOADS IN X-DIRECTION	59,221
3	GRAVITY LOADS AND BUOYANCY	0
4	TRANSIENT LIVE LOADS IN Y-DIRECTION	1,449
5	TRANSIENT LIVE LOADS IN X-DIRECTION	1,449
6 (=1+3+4)	VIBRATION IN Y-DIRECTION	60,762
7 (=2+3+5)	VIBRATION IN X-DIRECTION	60,670
